```

```
# Load data
data <- read_delim("raw_data.csv")
```

```
#####
##### STEP 1: Table 1 (Descriptive Table) #####
#####
```

```
# EXAMINE Time (Quantitative Variable 1)
table(data$Time)
mean(data$Time)
sd(data$Time)
summary(data$Time)
```

```
# EXAMINE Streams (Quantitative Variable 2)
table(data$Streams)
mean(data$Streams)
sd(data$Streams)
```

```
# EXAMINE Swifts_Emotions (Qualitative Variable 1)
table(data$Swifts_Emotions)
```

```
# EXAMINE Theme (Qualitative Variable 2)
table(data$Theme)
```

```
#####
##### STEP 2: Table 2 (Contingency Table) #####
#####
```

```
table(data$Swifts_Emotions, data$Theme)
```

```
#####
##### STEP 3: Chi squared test #####
#####
```

```
chisq.test(data$Swifts_Emotions, data$Theme)
```

```
#####
##### STEP 4: ANOVA #####
#####
```

```
# Perform ANOVA
anova <- aov(data$Streams ~ data$Theme)
# Summarize ANOVA results
summary(anova)
```

```
#####
##### STEP 5: Correlation #####
```

```
#####  
cor(data$Streams, data$Time)  
  
#####  
##### STEP 6: Linear Regression #####  
#####  
  
## examine the scatter plot ##  
linear_plot <- plot(data$Time, data$Streams)  
print(linear_plot)  
  
## calculate linear regression ##  
linear_relationship <- lm(data$Streams ~ data$Time)  
summary(linear_relationship)  
  
#####  
##### STEP 7: Figure 1 #####  
#####  
  
## slope ##  
abline(linear_relationship, col = "red")  
  
## mean of X on the x-axis ##  
abline(v = 232.5, col = "blue")  
  
## mean of Y on the y-axis ##  
abline(h = 264782281, col = "green")  
  
#####  
##### STEP 8: Examine residuals #####  
#####  
  
## plot the residuals ##  
plot(data$Time, residuals(linear_relationship))  
  
## add a horizontal line at zero to indicate the baseline ##  
abline(h = 0, col = "red")
```
